STIC/Biotech:

Please search SEQ ID NO: 1-4 against protein databases.

Please include an interference search.

Please send the results on DISK.

Thanks a lot...

Joseph F. Murphy, Ph.D.

 RECORD. ALL CITATIONS AVAILABLE IN THE RE FORMAT

AB The invention provides cell cultures and culture conditions that
 facilitate the establishment of an intestinal epithelial cell culture that
 has characteristics of the intestinal epithelium, such as: transepithelial
 elec. resistance, enzyme expression (expression of alkaline phosphatase,
 dipeptidyl peptidase IV, aminopeptidase, and aminopeptidase A) and
 microvilli morphol. Cell cultures of the invention may use fatty acids
 such as sodium **butyrate** and kinase modulators such as
 2-{1-[3-(amidinothio)propyl]-1H-indol-3-yl}-3-(1-meethylindol-3yl)-
 maleimide methanesulfonate (Ro 31-8220). In an example the
 differentiation of human SCBN cells under conditions of the invention was
 studied and gene expression profile and efflux transporter activity were
 determined Although the invention may be used to conduct permeability
screening in a manner similar to how Caco-2 the industry standard is
 used, it has a unique and novel application in identifying absorbable
 active ingredients in natural health products (or natural products or
 nutraceuticals or botanicals or herbals or dietary supplements) or any
 products that contain mixts. of ingredients of interest (as marker
 substances or active ingredients) or botanicals. Exemplary determination of

the ingredient profile of Gingko biloba is reported.

- TI Differential requirements of novel AlPiZ degradation deficient (ADD) genes in ER-associated protein degradation
- AB In the eukaryotic cell, a protein quality control process termed endoplasmic reticulum-associated degradation (ERAD) rids the ER of aberrant proteins and unassembled components of protein complexes that fail to reach a transport-competent state. To identify novel genes required for ERAD, we devised a rapid immunoassay to screen yeast lacking uncharacterized open reading frames that were known targets of the unfolded protein response (UPR), a cellular response that is induced when aberrant proteins accumulate in the ER. Six genes required for the efficient degradation of the Z variant of the α 1-proteinase inhibitor (AlPiZ), a known substrate for ERAD, were identified, and anal. of other ERAD substrates in the six AlPiZ-degradation-deficient (add) mutants suggested diverse requirements for the Add proteins in ERAD. Finally, we report on bioinformatic analyses of the new Add proteins, which will lead to testable models to elucidate their activities.
- IT Gene, microbial
 RL: BSU (Biological study, unclassified); BIOL (Biological study) (KAR2, kar2-1 and add double mutants; differential requirements of AlPiZ (α 1-trypsin inhibitor-Z) degradation deficient (ADD) genes in ER-associated protein degradation)
- IT Genetic element
 RL: BUU (Biological use, unclassified); BIOL (Biological study); USES (Uses) (UPRE (unfolded protein response element), reporter; differential requirements of AlPiZ (α 1-trypsin inhibitor-Z) degradation deficient (ADD) genes in ER-associated protein degradation)
